

## VRX180 TAC TIP

### **Assigning Output types to Analog Output points**

Analog output types in the VRX180 video recorder can be assigned as CAT (current adjustable type) or DAT (duration adjustable type). The VRX180 can support a maximum of two analog output modules (8 channels) assignable as CAT types and provides up to eight additional internal channels (addressed above the actual modules channel addresses) which can be assigned as DAT types.

**Please note :** assigning a mixture of CAT and DAT type outputs to channels on an analog output module will cause the CAT outputs to freeze.
